# Remaining Useful Life

# **Remaining Useful Life**

## The Remaining Useful Life is a key concept in predictive maintenance

The RUL refers to the time until a component becomes unusable

- If we can estimate the RUL of a component
- ...We can schedule maintenance operations only when they are needed

## Current best practices are based on preventive maintenance

I.e. on having a fixed maintenance schedule for each component family

- RUL prediction can lead to significant savings
- ...By delaying maintenance operations w.r.t. the schedule
- ...But only as long as we are still able to prevent critical failures

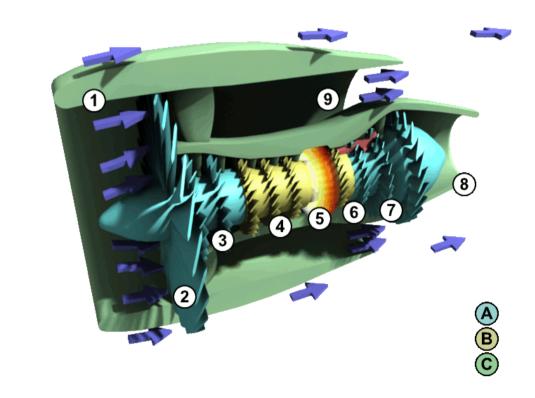

## The Dataset

## We will consider the NASA <u>C-MAPSS dataset</u>

- The Modular Aero-Propulsion System Simulation (MAPSS)
- ...Is a NASA-developed simulator for turbofan engines

■ It comes with both a Military (MAPSS) and commercial versionn (C-MAPSS)

#### The Dataset

## The C-MAPSS system can simulate a number of faults and defects

...And it was used to build a high-quality dataset for the PHM08 conference

- The dataset consists of 4 "training set" files and 4 "test set" files
- The training set files contain multiple run-to-failure experiments
- The test set files contain truncated experiments

## PHM-08 hosted a competition based on this dataset

The goal was to predict the RUL at the end of each truncated experiment

- This is fine as long as the focus is on pure prediction
- ...But we want to tackle the whole predictive maintenance problem

As a consequence, we will focus only on the "training" data

## The Dataset

## Each training file refes to different faults and operating conditions

Dataset	Operating conditions	Fault modes
FD001	1 (sea level)	HPC
FD002	6	HPC
FD003	1 (sea level)	HPC, fan
FD004	6	HPC, fan

Fault modes refer to degration of either:

- The High Pressure Compressor
- The fan at the "mouth" of the engine

## Inspecting the Data

#### Let's have a look at the row data

```
In [2]: data folder = os.path.join('...', 'data')
          data = util.load data(data folder)
          data.head()
Out[2]:
                     src machine cycle
                                                                                                   s13
                                           p1
                                                   p2

                                                                              645.110000
                                                                                             1616.910000
                                                                                                            1441.490000
                                                                                                                           14.620000
           max
            8 rows × 24 columns
```

#### There are no missing values:

```
In [4]: data[dt_in].isnull().any().any()
```

## Let's prepare for displaying all time series

First, we standardize each column:

```
In [5]: data_sv = data.copy()
  data_sv[dt_in] = (data_sv[dt_in] - data_sv[dt_in].mean()) / data_sv[dt_in].std()
```

Then, we split our data based on the source file:

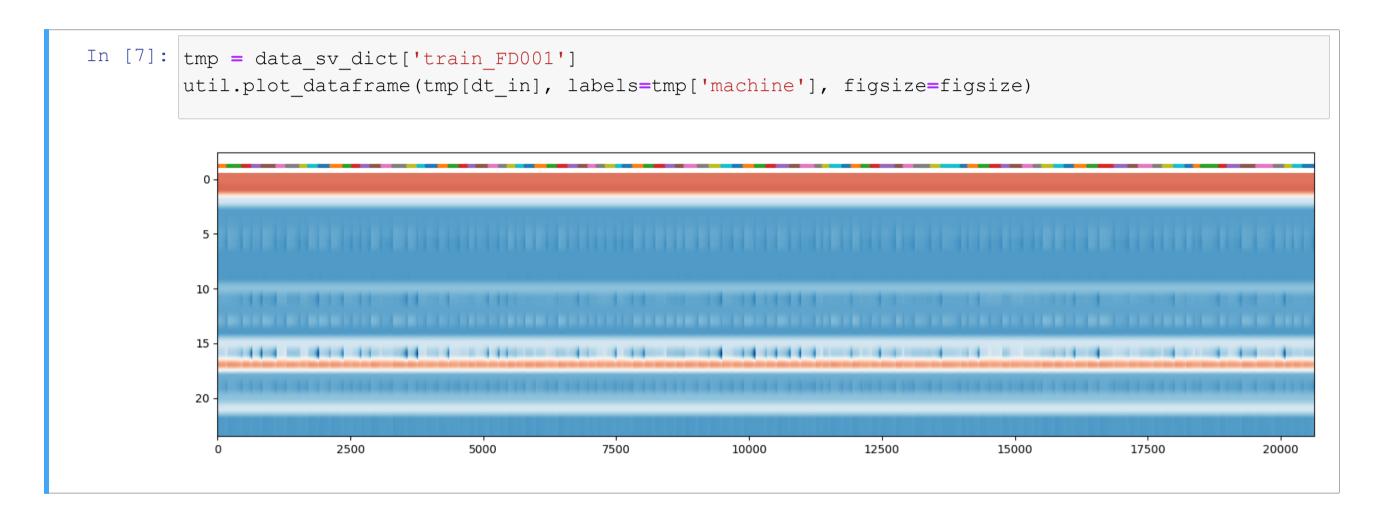

```
In [6]: data_sv_dict = util.split_by_field(data_sv, field='src')
    print('{{{}}}'.format(', '.join(f'{k}: ...' for k in data_sv_dict.keys())))

{train_FD001: ..., train_FD002: ..., train_FD003: ..., train_FD004: ...}
```

## Now, let's plot all parameters and sensors for FD001

- The data contains series for multiple machines
- These are highlighted at the top with different colors

## Now, let's plot all parameters and sensors for FD002

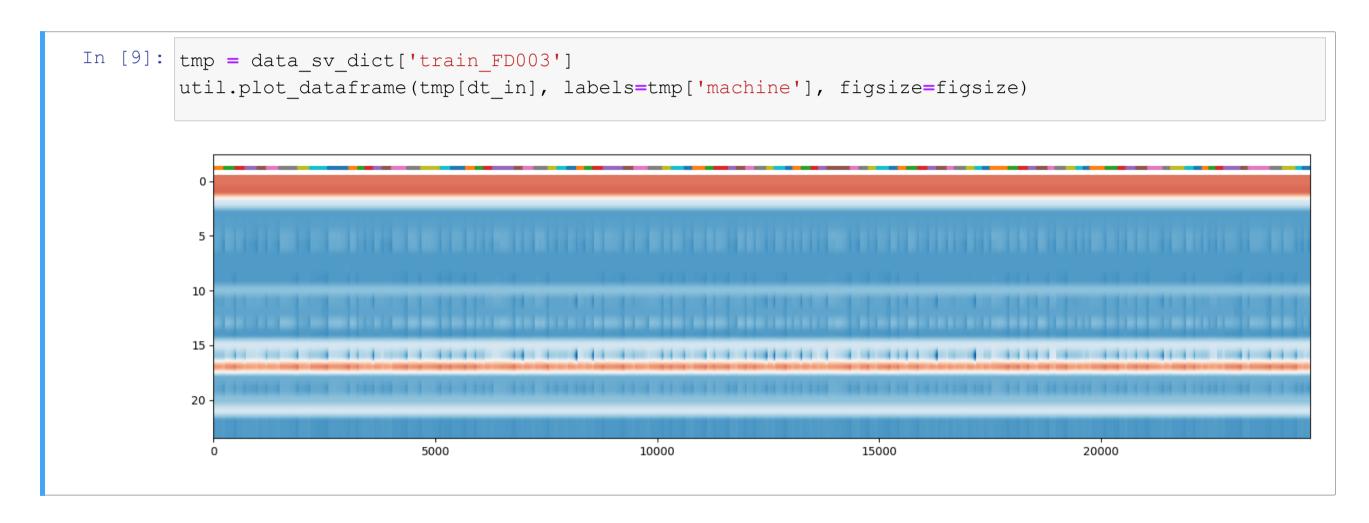

- The series is much more variable in this case
- This is due to the multiple operating conditions

## Now, let's plot all parameters and sensors for FD003

- Only one operating condition in this case (but two fault modes)
- The series is similar to FD001

## Finally, let's plot all parameters and sensors for FD004

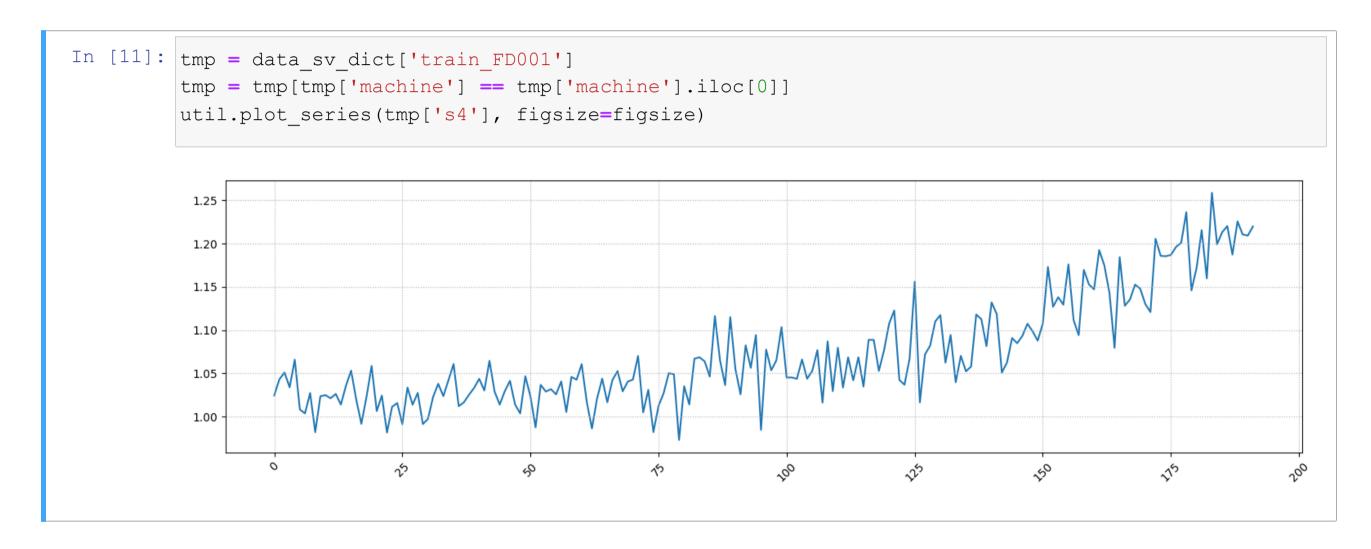

- Again six operating conditions
- ...And the series is similar to FD004

## Let's plot one column in deeper detail for a single machine in FD001

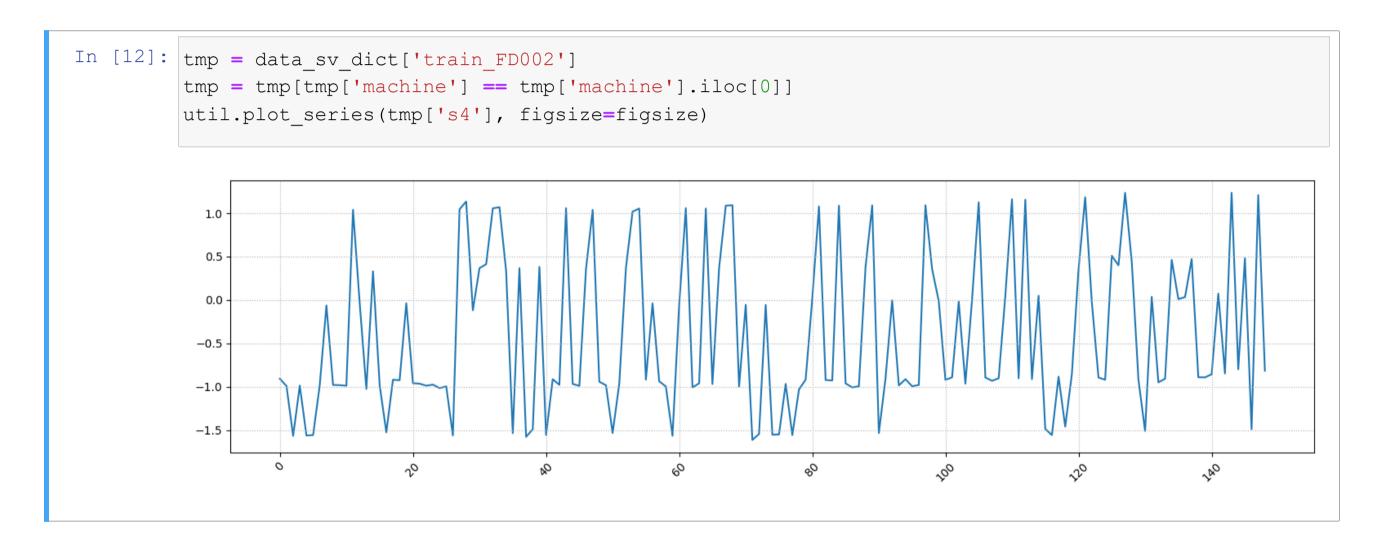

A clear trend, possibly correlated to component wear

#### Let's see the same column for FD002

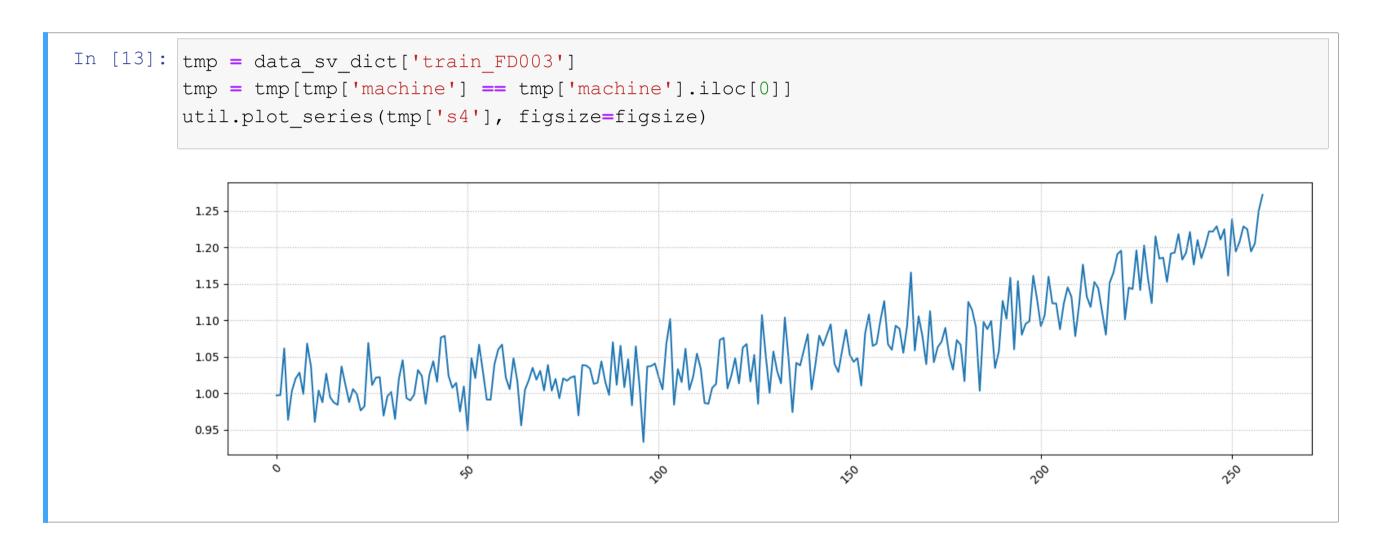

■ The trend is still present, but weaker and hidden by wide oscillations

#### ...And then the same column for FD003

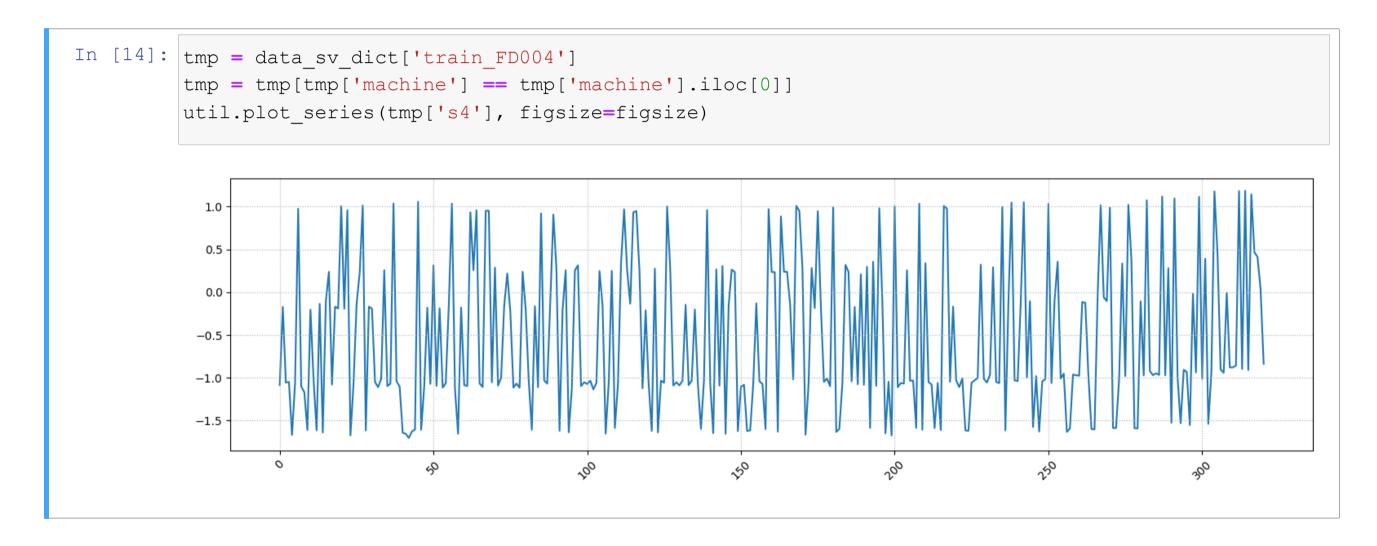

■ Clear trend, with small oscillations that are more frequent than FD001

#### Let's see the same column for FD004

■ Very weak trend, wide and frequent oscillations
